

ABSTRACT OF DISLCOSURE

A flash unit for a camera comprises a bracket, a reflecting member, two fixed members and a flash emission tube. The bracket is disposed inside the camera, and the reflecting member is disposed inside the bracket. The fixed members are integrally formed on the bracket, and the flash emission tube is fixedly disposed inside the bracket by the fixed members. By integrally forming the fixed members on the bracket, the conventional rubber band for fixing the emission tube can be replaced. Since the number of the consisting elements of the flash unit are thereby reduced, its cost can also be reduced. In addition, assembly time can also be reduced.
